

## Heat Tracing Storage Tank

### Project: Industrial Facility, Ireland

#### Scope of Supply

- Heat tracing solution applied across a 50,000L storage tank
- Thermostat-controlled system for consistent temperature maintenance
- Ancillaries, including terminations and fixing accessories

#### Application Details

- The system was designed to maintain a viscous media at a constant temperature within the 50,000L tank.
- Heat tracing ensured even distribution of warmth across the tank surface in 7 different 'zones'.
- This prevented the media from cooling, thickening, or causing blockages in downstream processes.

### Outcome

The solution safeguarded the stored product's integrity and ensured system reliability. By maintaining stable thermal conditions, the client avoided downtime, reduced maintenance risks, and achieved improved operational efficiency.
